Hurricane Safety – Clean Up Picture This

The image shows an individual cleaning up debris after a hurricane, surrounded by piles of vegetation, broken items, and scattered materials. While cleaning up is a necessary step after a storm, the individual appears to lack proper safety equipment such as gloves, sturdy footwear, and protective eyewear, which are crucial when handling potentially hazardous debris. The debris may contain sharp objects, hazardous materials, or contaminated water, all of which can pose health and safety risks without adequate precautions.

During hurricane cleanup, it’s essential to wear appropriate personal protective equipment (PPE), including gloves, safety goggles, heavy-duty boots, and long sleeves to protect against cuts, infections, and exposure to hazardous substances. Assess the area for potential dangers such as downed power lines, unstable structures, or contaminated floodwater before beginning cleanup efforts. Use tools like rakes and shovels to handle debris instead of bare hands, and stay hydrated and take breaks to avoid overexertion. Proper disposal

of debris according to local regulations helps maintain safety and sanitation in the affected area.
