

# Wellness – Taking Care of Your Blood Pressure Meeting Kit

## WHAT'S AT STAKE

Taking care of blood pressure is not something to just brush aside. Think of it like this: your blood pressure is the force of your blood pushing against the walls of your arteries. When that pressure is consistently too high, even though you might not feel it, it's like your plumbing system is constantly under extra strain. And over time, that extra strain can really damage some of your most important parts – your heart, your brain, even your kidneys and eyes. That's why keeping an eye on it and taking care of it is so crucial for staying healthy and feeling good down the road.

## WHAT'S THE DANGER

It's important to remember that for many individuals, high blood pressure develops gradually over time without any obvious warning signs. This is why it's often referred to as the "silent killer."

### Immediate Indicators

In the near term, alarmingly high blood pressure can manifest through noticeable signs such as severe headaches, nosebleeds that are difficult to stop, overwhelming fatigue, episodes of dizziness, or disturbances in vision. These symptoms serve as urgent signals that prompt and immediate medical evaluation is necessary.

### Progressive Health Threats

The more critical dangers unfold gradually due to the sustained impact of elevated blood pressure. This continuous, often silent, strain can inflict damage upon blood vessels throughout the body, thereby escalating the likelihood of developing:

- **Cardiac Events:** Weakened or narrowed arteries impede blood flow, potentially leading to a heart attack.
- **Cerebrovascular Accidents:** Blocked or ruptured blood vessels supplying the brain can cause a stroke.

- **Myocardial Insufficiency:** The heart's increased workload against high pressure can eventually lead to its weakening and subsequent heart failure.
- **Renal Impairment:** Damage to the kidney's blood vessels can impair their function, possibly resulting in kidney failure.
- **Ocular Damage:** Compromised blood vessels in the eyes can lead to vision problems and even blindness.
- **Cognitive Decline:** Reduced blood flow to the brain can affect cognitive function and increase the risk of vascular dementia.

## HOW TO PROTECT YOURSELF

To protect yourself from the dangers of high blood pressure, a combination of lifestyle modifications and regular medical monitoring is key.

### Adopt a Heart-Healthy Diet

Focus on a diet rich in fruits, vegetables, and whole grains. Limit saturated and unhealthy fats, cholesterol, and sodium. For example, instead of processed snacks, try reaching for a handful of almonds or a piece of fruit. When planning meals, aim to include plenty of colourful vegetables like broccoli, carrots, and spinach. The DASH (Dietary Approaches to Stop Hypertension) diet is specifically designed to help lower blood pressure.

### Maintain a Healthy Weight

Being overweight or obese puts extra strain on your cardiovascular system. Losing even a small amount of weight can have a significant impact on blood pressure. Even losing 10-15 pounds can make a noticeable difference for many individuals with high blood pressure.

### Engage in Regular Physical Activity

Aim for at least 150 minutes of moderate-intensity or 75 minutes of vigorous-intensity aerobic activity per week. This could look like a brisk 30-minute walk five days a week, or more intense activities like running or cycling for shorter durations. Regular exercise helps strengthen your heart and lower blood pressure.

### Manage Stress

Chronic stress can contribute to high blood pressure. Practice stress-reducing techniques like mindfulness, meditation, yoga, or engaging in hobbies you enjoy. For instance, taking 10 minutes each day for a quiet meditation or spending time on a relaxing hobby like gardening can help manage stress levels.

### Limit Alcohol Consumption

If you choose to drink alcohol, do so in moderation. For healthy adults, that means up to one drink per day for women and up to two drinks per day for men.

### Don't Smoke

Smoking damages blood vessels and significantly increases the risk of high blood pressure and other cardiovascular diseases. If you smoke, quitting is one of the best things you can do for your health.

## **Monitor Your Blood Pressure Regularly**

Have your blood pressure checked regularly by your doctor, even if you feel healthy. Your doctor may also recommend home blood pressure monitoring.

## **Follow Your Doctor's Recommendations**

If you are diagnosed with high blood pressure, it's crucial to follow your doctor's treatment plan, which may include medication. Take all medications as prescribed.

## **FINAL WORD**

So, when it comes down to it, looking after your blood pressure is really about taking charge of your health for the long haul. It's about building those everyday habits. Think of it as your way of keeping your engine running smoothly and protecting yourself from some serious bumps in the road later on.
