What's at Stake?

From soda pop spilled on the breakroom floor at a local factory, to a chemical spill from that same factory that pollutes the river and contaminates your

community's water supply–workplace spills can range from minor inconveniences to major catastrophes.

What's the Danger?

Spills present a danger to workers, the community and the environment. Knowing where spills are likely to occur can help you be on the lookout for them and ways to prevent them. Here are seven common sources of workplace spills:

1. Chemicals that are not stored or handled correctly.
2. Leaking or ruptured containment vessels.
3. Burst pipes.
4. Faulty equipment.
5. Equipment and piping systems that haven't been properly blocked, drained and locked out before maintenance or repair work is undertaken.
6. Accidents involving tanker trucks, ships and railcars carrying toxic chemicals, oil or gasoline.
7. Human error.

How to Protect Yourself

Of course, it's best if a spill never happens but when one does, a quick and correct response goes a long way to minimizing the damage and protecting yourself, co-workers, the community and the environment.

Here are seven tips for spill prevention and control:

1. Ask your supervisor whether your company has a spill prevention and control or contingency plan. If the answer is no, ask whether one can be developed and implemented.
 - a. The plan should list storage areas, equipment and processes that have the potential for spills.
 - b. It should also outline procedures for spill response.
2. Properly store and label all chemicals.
3. Inspect, maintain and repair equipment, machines, vehicles and vessels.
 - a. Regular inspection and maintenance keeps equipment and machines running smoothly and lets you identify potential hazards before they become a problem.
 - b. Install drip pans, containment barriers or drains to safely contain or divert spills.
4. Barricade or mark edges of wet areas and processes to keep people out when

containment isn't possible.

5. Request training on what to do in a spill emergency.

a. Some spills can safely be cleaned up with the proper training and protective equipment.

b. Some spills require special or emergency services for cleanup.

6. Ask your supervisor to set up spill kits and ensure that:

a. Kits are clearly marked.

b. There are enough kits on site and in all high spill risk locations.

c. Kits are stocked with the right type of absorbent and cleaning materials.

d. Kits are checked on a regular basis and refilled after a spill incident.

7. Ensure that all spills, regardless of size or material, are cleaned up immediately and reported in accordance with your workplace's spill plan and regulatory guidelines.

Final Word

Remembering the seven common sources of workplace spills and seven ways to prevent and control them can help make sure spills are more of a minor inconvenience and not a catastrophic event.
